

## **New Sustainability Course –**

### **Summary Description**

The graduate civil and environmental engineering department has asked me to develop and start a new course entitled, "Sustainability for Project Managers." After significant research, I have formulated a plan for this new course to be started in the summer of 2014. The summary of the course objective is as follows:

Upon completion of this course, the student will be conversant on the subject of sustainable project management, including, but not limited to the planning, design, construction, sustainment, and modernization criteria, as applied to sustainable facility project management, as well as to able to identify the concepts, practices, and impacts of facilities sustainment, the longest and most costly function in the life cycle of a facility.

A copy of the full syllabus is attached for your information and use.

Please advise if any further information is needed.

Thank you for the great learning experience of attending the Chesapeake Project Workshop in May.
